To whom it may concern:

I am writing to request an interview. As a member of your company I will be able to contribute to the future success of the company while enhancing my knowledge in the industry.

As a current web application developer, I realize that for every function to be successful the user's experience must be put first. This means taking the extra mile to ensure that a clean, easy to use interface allows the audience to accomplish their goals in an efficient and timely manner. I have developed applications ranging from a PHP customer relationship management system to creating VB .NET and C# custom reports / jobs. For the past three years I have developed and managed successful custom and pre-built eCommerce websites for Fortune 500 companies. There is a heavy emphasis on creating the best experience for the user by providing a simple interface for the customer to accomplish their goal. These projects have forced me to be detailed orientated down to pixels. These skills will help decrease any training time allotted for this position and allow me to be a productive member of your team more readily.

Learning new technology is a rewarding and intricate process. I have been involved in the beta stages of projects before and asked to provide feedback and trouble shoot: place.it, Web Evaluationor, Code Canyon, Quake Live, Saga, Runes of Magic, and Guild Wars. These projects involve two web applications, one website, one browser based game, as well as three software games. Having taken part in these ventures, I am now better suited at providing accurate detailed information. In addition, my technical report writing course has further developed my skill in communicating properly and effectively in the workplace.

In the computing world, there are many environmental variables that can affect the outcome of a specific sequence. Even though our methodology may be the same, software has dynamic variables that can affect the process in a negative manner such that it no longer installs or functions properly. Since there are so many variables, both static and dynamic, it can take time to trouble shoot the proper issue. I feel I have a good knowledge on moderate issues in a computing environment and a better knowledge in trouble shooting advanced web development, database, and SQL issues. I do have 6 years of experience using Eclipse for Java and C++ compiling. With these skills, I can significantly contribute to your community in a productive and positive way. I look forward to your reply.

Regards,  
Andrew Lechlak
